

UBC Urban Landscape Architecture Project

Project Background

This work was completed during my UBC SALA summer school program, which focused on urban landscape renewal and sustainable public space design. Guided by Vancouver's local urban context and park design characteristics, our team was required to create a scaled interactive miniature park using only limited and recyclable materials. The project emphasized observing the city's inclusive urban temperament, human-centered spatial logic, and highly interactive landscape layout. Different from decorative landscape models, our design prioritized social communication and interpersonal connection, creating an open, chat-friendly public resting environment that reflects Vancouver's relaxed and community-oriented urban aesthetics

Project Resaerch

Vancouver's public realm balances untamed coastal natural scenery with human-centred urban construction. Local community parks prioritize open, boundary-free layouts to facilitate casual social interaction, rather than formal decorative landscaping. Downtown historic Gastown features minimalist modular brick-and-timber structures, lightweight recycled construction textures, and adaptive reuse of leftover urban corner spaces to form pocket public nodes. Meanwhile, the city consistently adheres to low-intervention landscape principles, integrating native vegetation with hard architectural structures to maintain harmony between urban built environments and Pacific wilderness.

Based on on-site field investigation across Vancouver's coastal parks, historic downtown districts and Pacific waterfront landscapes, I summarized the city's iconic urban design genes and translated these contextual features into my scaled park prototype.

Design Concept

Absorbing these local characteristics, I adopted recycled wooden sticks to mimic Vancouver's rustic, sustainable construction texture. I arranged enclosed face-to-face seating to inherit the city's inclusive social atmosphere, added fresh natural plants to echo Vancouver's nature-city integration concept, and applied modular assembled frames referencing historic downtown architectural language, completing a localized miniature interpretation of Vancouver urban landscape.

Production Process

Final Outcome

Built mainly with recycled wooden sticks, this miniature park contains multiple interactive and ornamental facilities. I created face-to-face interactive seating to support relaxed social communication, equipped a small seesaw for playful public interaction, and decorated the site with live plants and wooden frames to form delicate ornamental landscape decorations. The whole work integrates sustainability, interactivity and local Vancouver landscape features, completing the design practice of small-scale inclusive urban public space.
